

Video Title: **Cloud\_Layering\_2**

From this view, you see at least two layers of clouds. It is possible that there are 3 layers, however the combination of translucent and opaque visual opacity of the high level cirrostratus clouds, and mid level altostratus layers keep possible cloud formations at the low level hidden from view.

As we move further along, you begin to see at the bottom of the screen a break in the top high and mid level clouds revealing altocumulus cloud mixture at the mid level, it is not apparent whether or not low level cloud formations exist, but you can tell that these observations were made over the ocean.
